

Children can learn to write easily!

- Like a game, with no stress but with fun
- just in the same way as with paper and pen,
- no shift of culture, in a neutral way.

Children learn to write letters and words and to count all by themselves, and not to consume but to use a computer for what it really is: just a tool.

This avoids stress for the parents and allows optimal monitoring of success

e-LHESY is a learning console that makes completely objective assessments.

- which records a first-class human communication process – handwriting – in four dimensions,
 - which compares the input of the text or numbers against a given reference sample of writing,
 - which determines the degree of matching, and
 - gives the corresponding visual signal, for example, a laughing Donald Duck for a good match, or an angry Donald Duck for an inadequate match against the reference sample.
- Or which determines the right form of writing and the correct results for tasks involving arithmetic, and which reacts as described above.
 - This is supported by acoustic signals or by instructions over a loudspeaker concerning the input of the writing.
 - e-LHESY allows writing on normal paper at the same time and is thus a form of Crossover Media, or else THE bridge between the conventional, the familiar and the new,
 - this being done without “culture shock” and in a neutral way to ensure a smooth transition to modern technologies.
 - And all without putting pressure on children, parents and teachers.

The HESY writing area is a tablet that has four pressure sensors underneath it. It is a form of “writing scales” that records and evaluates all the dynamics of the handwriting. The movable hand rest makes it suitable for both left-handed and right-handed persons.
